

## Aqua-Hort and Algae

Over time there has been reports about the effect on algae by the Aqua-Hort system. Goldsmith Seeds in California has, in cooperation with Lars Marohn the US agent, made specific trials to test this effect. For Goldsmith Seeds it is important that the newly sown plants are not hampered by algae growth on the surface of the plugs.

Trays with plugs were watered for some weeks. Half with normal water and the other half with Aqua-Hort water. Dosing rate 2,5 ppm.

The picture shows the outcome. The plugs to the left are untreated, and those to the right are Aqua-Hort treated.

The untreated plugs shows heavy algae growth, while the treated plugs are clean.
